

Mail Protector

Prevent junk & infected email from reaching your system

Guard your business, and save time without that frustrating junk mail

Guard your business with Mail Protector. Keep employees and customers safe from email borne threats. Our email solutions eliminate spam and inappropriate content to protect your employees and the reputation of your business. Save time as you & your employees no longer have to sift through junk mail.

Protect your system

Mail Protector checks all incoming email in real-time for viruses, spam and phishing. Any emails containing threats will be blocked before they even reach your network. Suspected spam will be sent to the quarantine area, ensuring that your users only receive clean, legitimate email. Quarantined emailed can be viewed, any legitimate emails then can be released and the system will be trained no to block such emails again.

Don't lose email if your mail server fails.

Without mail protector, if your mail server fails then incoming emails will either bounce back to sender, or will be lost. Mail Protector will save sent emails until your mail server is back up and running then send them on as normal. If your mail server is down for any length of time then email can be forwarded to any other email account (such as a webmail account).

Be assured Mail Protector is doing its job

Mail Protector now automatically generates comprehensive reports to provide all the management information you require about your mail traffic. Generated weekly and monthly, they are emailed as a PDF to each customer Administrator.

Mail Protector will automatically send out a mail scanning report each month for all of its customers highlighting:

- Customer's service account information
- Proportion of blocked mail
- Total mail scanned
- Filtering analysis
- Mail classified as spam, virus or clean

Pricing
