

Ultimate backup & disaster recovery system

What would it mean to your business if your server failed?

In most cases businesses run a tape backup system that will copy your files to a tape over night, so are your important files safe? Did you know that 42% of tape restores fail! Even if your tape backup is working and a restore can be relied upon have you thought about how long it would take to obtain new server hardware, and have the software rebuilt. All the time you are waiting for this your office and staff are out of action without access to emails, accounts, and other operational information.

What is the solution?

The Ultimate backup and disaster recovery system!

The ultimate system is a box that sits in your office and backs up your system every night. The box also creates a virtual copy of your server's every night, if your main server fails then the backup box will act as your main server allowing your office to continue to operate as normal. When you have obtained new hardware or repaired the problems with your main server the box will restore all your software and information back. A copy of all of your system will also be copied to a data centre in Sunderland, meaning that if your office had a complete disaster (burglary, flood, fire, etc), you can simply log into a virtual copy of your system from home or an alternative office.

Features and benefits:

- ✓ No more changing backup tapes or disks.
- ✓ After a complete failure, you do not suffer long amounts of downtime, as a virtual system is instantly available.
- ✓ Both an onsite and offsite virtual system are created every night of your system.
- ✓ Can still access a virtual copy of your system online even if your office has a complete disaster (burglary, flood, fire etc).
- ✓ Online copy of your data is local, if large amounts of data needs to be recovered in a hurry then it can be supplied on a disk. Alternative suppliers require hours, if not days of download time to restore your files.
- ✓ Can backup and create virtual copies of multiple servers.
- ✓ Online data is encrypted, it can only be accessed with a password YOU have created.

Did you know...

- There is only a 30% survival rate for UK businesses that suffer significant data loss.
- 42% of tape restores fail.
